

APPENDIX G. Total Nitrogen, Sedimentation/Siltation, and Other Non-Standards-Based Pollutants as Causes of Use Impairment in the Integrated 305(b)/303(d) Water-Quality Report

Background

In reporting-cycle 2008, the Illinois Environmental Protection Agency (Illinois EPA) dissociated all instances of *total nitrogen* as a cause of impairment of Aquatic Life Use from the impaired-waters list submitted to the U.S. Environmental Protection Agency (USEPA). Similarly, Illinois EPA dissociated some instances of *sedimentation/siltation* as a cause of impairment of Aquatic Life Use. As of February 2019, USEPA had deferred deciding whether to approve some of these changes. Now, USEPA and Illinois EPA have achieved resolution on these deferred decisions. Additionally, USEPA and Illinois EPA agree about how Illinois EPA can begin to address various pollutant causes, of use impairment, that remain associated with the latest "303(d)" list of impaired waters, but that are not based on Illinois water-quality standards. Such causes include—but are not necessarily limited to—phosphorus in water and each of various chemical substances in sediment. In agreement with USEPA, Illinois EPA presents the following resolution, with distinct application to reporting cycle 2018 relative to future cycles.

Reporting Cycle 2018

For the cycle-2018 integrated water-quality report, Illinois EPA adds *total nitrogen* as an observed effect for each of 66 stream segments (i.e., Assessment Units) for which USEPA deferred decision as of February 2019 (Table 1). Also, Illinois EPA adds *sedimentation/siltation* as an observed effect for each of two stream segments (Table 2).

Reporting Cycles 2020 and Later

Observed Effects

For the cycle-2020 and later integrated water-quality reports, if Aquatic Life Use becomes attained in a stream segment with which at least one of the two aforementioned observed effects is associated, then Illinois EPA will dissociate the observed effect because the use is no longer impaired. For stream segments having at least one of the observed effects and for which Aquatic Life Use remains not attained, Illinois EPA may opt to assess removal of the observed effect(s). To assess removal of the observed effects requires applying the relevant Illinois EPA cause guidelines used during reporting cycle 2006. Specifically, to justify removal of *total nitrogen* as an observed effect would require that none of the most recent, applicable results of nitrate/nitrite in water exceeds 7.8 mg/l. To justify removal of *sedimentation/siltation* as an observed effect would require that none of the most recent, applicable observations of stream-bottom composition indicate more than 50% of the stream bottom comprising silt, mud, or equivalent fine sediment. Typically, the most recent, applicable results are those from a three-year period—consistent with prevailing Illinois EPA assessment methodology. Illinois EPA will not apply these guidelines for any new identifications of observed effects or causes of impairment. However, if Illinois adopts a new, numeric water-quality standard for total nitrogen or

sedimentation/siltation (subject to USEPA approval) and Illinois EPA develops a corresponding standards-based guideline for either substance as a cause of Aquatic Life Use impairment, then the aforementioned approach for removing an observed effect no longer applies.

Non-standards-based pollutant causes of use impairment

In reporting cycle 2020, several pollutant causes of use impairment remain associated with impaired waters despite these causes lacking a basis in Illinois water-quality standards. In past reporting cycles, Illinois EPA applied various cause guidelines that were not based on Illinois water-quality standards. Illinois EPA has since stopped using these cause guidelines, yet causes remain as a result of past application. Starting in cycle 2020 and extending to later cycles, Illinois EPA may opt to dissociate (remove) these causes of impairment even if the relevant use remains not attained. To assess removal of these causes requires applying the relevant cause guidelines that Illinois EPA last used to identify these causes. Specifically, for any such cause, to justify removal would require that none of the most recent, applicable results or observations exceed the former cause guideline. Illinois EPA will not apply these former guidelines for any new identifications of causes of use impairment. However, if Illinois adopts a new, numeric water-quality standard for any of the relevant pollutants (subject to USEPA approval) and Illinois EPA develops a corresponding standards-based guideline for the pollutant as a cause of use impairment, then the aforementioned approach to remove the cause no longer applies.

Table 1. Cycle-2018 Assessment Units for which USEPA deferred decision—as of February 2019—on Illinois EPA's cycle-2008 dissociation of *total nitrogen* as a cause of Aquatic Life Use impairment. (Assessment Unit IL_MNID-C4 was formerly named IL_TM-36 in 2008.) For reporting cycle 2018, Illinois EPA adds *total nitrogen* as an observed effect for each Assessment Unit except IL_DSQ-03 and IL_GI-06, in which the relevant aquatic-life use is attained.

Assessment Unit	Name	2018 Attainment Status of Aquatic Life Use or Indigenous Aquatic Life Use
